RECORD TECHNOLOGY LABS

Mobile Video Verification Flow

Full Stack Developer – Onboarding Task

Task Overview

Build a mobile-friendly video verification flow based on the screens and designs shared in the Figma file. A candidate should be able to open their verification link, select English, go through the instructions, allow the required device permissions, answer three questions by recording videos, submit their responses, and share feedback at the end.

The main focus is to recreate the Figma design accurately and make sure the complete flow works smoothly on both Android and iOS devices. The candidate's progress must also be saved automatically so they can continue from where they stopped if the page is refreshed or reopened.

Design Reference

Please use the shared Figma file as the reference for the screen designs, content, layout, colours, fonts and spacing.

Figma link: https://www.figma.com/design/WOPN1JG2lhDfN6f5LRsDur/Untitled?node-id=3-1384&t=ClC2q5VOGlpwrKcV-0

Technology Stack

Use the following stack for the implementation:

- Preferred Stack : MERN
- Frontend: React + TailwindCSS + ShadCN UI
- Backend: Node.js + Express
- Database: MongoDB
- Video storage: Secure file or object storage, with the required video details saved in MongoDB

Application Flow

1. Open verification link

When the candidate opens the link, check whether it is valid and has not expired. If the candidate has already started the process, load their saved progress.

2. Select language

Show the language selection screen. For this task, only English should be available for selection. The candidate must select English before continuing.

3. Show instructions

After the candidate clicks Continue, display the instruction screens one by one, following the order and content in Figma. The candidate should be able to move through the screens using the provided Continue button.

4. Request permissions

Before starting the verification, request access to the location, microphone and camera. Explain why each permission is needed. Handle cases where permission is denied and guide the candidate on how to enable it.

5. Display the questions

Show the current question clearly on the mobile screen, along with the video recording controls.

6. Record video responses

Allow the candidate to record a video response for each question. Show the camera preview and recording status. Provide the option to stop and review or re-record where required by the design.

7. Complete all three questions

The candidate must answer all three questions. Save each video separately and make sure an earlier response is not lost when moving to the next question.

8. Submit responses

Once all three videos are successfully saved, allow the candidate to submit the verification. Show a confirmation after the backend confirms that the submission is complete.

9. Collect feedback

After submission, display the feedback screen and save the candidate's feedback against the same verification record.

Important Requirements

- **Mobile design:** The complete flow should work on Android and iOS mobile browsers. Follow the Figma design closely and make sure the screens fit different mobile screen sizes.
- **English only:** Only English should be selectable. Other language options should not be available for this task.
- **Permission handling:** Request camera, microphone and location access at the correct stage. The flow should handle both granted and denied permissions properly.
- **Automatic saving:** Save the candidate's progress as they move through the flow. This includes the selected language, completed instruction screens, permission status, current question and completed video responses.
- **Resume after refresh:** If the candidate refreshes the page, closes the browser or opens the same link again, the application should retrieve the saved progress from the backend and continue from the appropriate step. It should not start again from the beginning.
- **Video storage:** Save the recorded videos securely. Store the related video reference and details in MongoDB so that the backend can retrieve the correct video for each question.
- **Link expiry:** The verification link should have an expiry time. Once the candidate successfully completes the verification, the link should be marked as completed and should not allow another submission.
- **Submission validation:** Do not allow final submission until all three video responses have been uploaded and confirmed as saved.
- **Feedback storage:** Save the feedback submitted at the end of the flow and associate it with the candidate's verification record.

Backend and Data Handling

The application should save the verification details and progress in MongoDB. Each candidate's verification record should contain the current step, selected language, permission status, question responses, video references, submission status and feedback.

Video files should be stored securely, with their storage references and relevant details maintained in MongoDB. The backend should validate the verification link, check its expiry, retrieve saved progress and prevent duplicate or incomplete submissions.

Testing

Please test the complete flow in Android Chrome and iOS Safari. Make sure to check the following:

- The screens match the Figma design and work on mobile devices.
- English selection and the Continue flow work correctly.
- Camera, microphone and location permissions are handled properly.
- All three video responses can be recorded and saved.
- Refreshing or reopening the link resumes the candidate from the saved step.
- The flow handles denied permissions, interrupted recordings and failed uploads without losing saved responses.
- Expired and completed links cannot be used to start another verification.
- The final submission and feedback are saved and can be retrieved from the backend.

Submission

Please share the completed work with the following:

- GitHub repository link with the complete source code.
- A README file explaining how to set up and run the application.
- Screenshots of the complete mobile flow, from language selection to the final feedback/completion screen.
- A short note confirming the Android and iOS browsers used for testing.

All the best!
